How many here have Windows 8.1 on their desktops? Windows 7 is fine, but Windows 8 is a disaster, so I am. I think this is a general problem. I was able to use Sinhala unicode perfectly well with Windows 8.1 platform. I was also able to use different Cyrillic fonts while Windows 8.1 made me use a Sinhala font that I had to choose from. I am not sure if the problem is because of the language packs or the way the system handles unicode in Windows 8.1. It is something that is driving me crazy. A: The problem is that some font renderers are not designed to take into account the fact that some characters have 2 representations (namely, when there is a way to say the same thing in both the Latin script and a Latin-script specific script). Some devices are smart enough to be able to use one of those representations in the system font, which is a font that is already installed on the device. But other devices need you to provide the specific fonts, or at least the specific font. You'll have to edit the font, make it display both the characters, and see if it will change the font it is now using. Edit: some pointers for the unicode tool (the one that shows the characters): If your font is not included in Unicode, that means that font is not generally recognized. In that case, you have no choice. You have to provide it, or provide another one that you know works, or work without the font. If the font is one you chose (and it is a Microsoft font), it is likely in a specific range of numbers that you do not use. Edit2: in your case, the font seems to be included. Probably, try: font -f (font name) and see which of the unicode script codes correspond to your symbol. Edit3: according to the MSDN page about unicode and font usage: on the Microsoft Windows system, the fonts that are installed in the English language code page are also available in many other language code pages. For example, the fonts available in the Arabic language code page are the same as those available in the English language code page. The number of characters available in the Arabic language code page is larger than in the English language code page. However, there are several differences in the display of these
